chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in traating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PGR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44569 and AAB55154 to AAB55300 represent human PRO Polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, PRO; benign tumour; malignant tumour; lymphoid malignancy; leukaemia; neuronal disorder; stromal disorder; blastocoelic disorder; inflammatory disorder; immune disorder; anglogenic disorder; cytostatic;

The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PRO polynuclectides used to produce polypeptides used to target bioactive molecules such as toxins, radiolabels or antibodies, to specific cells, to cause targeted cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Godowski PJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -100N-
ö
                                                                                The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agnists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypochalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. AAU86128-AAU86162 represent the human PRO polypeptides of the invention
                                                                                                                                                                                                                                                         MKLAALLGLCVALSCSSAAAFLVGSAKPVAQPVAALESAAEAGAGTLANPLGTLNPLKLL 60
                                                                                                                                                                                                                                                                     Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumors, leukemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; PRO; cytostatic; tumour; cancer; breast; lung; stomach; liver; horse; cow; dog; cat; sheep; pig; goat; rabbit; ADEPT; antibody-dependent enzyme mediated prodrug therapy.

The invention describes an isolated human PRO polypeptide. The PRO colypeptides are useful in detecting PRO polypeptides in a sample, in polypeptides are useful in detecting PRO polypeptides in a sample, in in modulating at least one biological activity of a cell expressing a PRO cin modulating at least one biological activity of a cell expressing a PRO cin modulating at least one biological activity of a cell expressing a PRO cin modulating at least not biological activity of a cell expressing a PRO cin modulating cardiac insufficiency disorders. PRO1154 and PRO1186 continual captulary endothelial growth, and PRO516, PRO943, PRO628, PRO1068 or PRO535, PRO626, PRO1166, and PRO1367 induce c-fos in endothelial growth, and are thus conditions or disorders where angiogenesis would be beneficial, e-g. wound healing and antagonist of this polypeptide are useful for treating conditions or disorders where angiogenesis would be conditions or disorders where angiogenesis would be conditional growth factor (VECEF) stimulated proliferation of conditional growth and PRO1366 and PRO1184, PRO1364 and PRO1375 stimulated proliferation of mammals which would be beneficial in inhibiting tumour growth. PRO826, PRO:068, PRO1184, PRO136, and PRO:068 or PRO:068 or PRO:068, PRO:068, PRO:068 or PRO:068 or PRO:068, PRO:068, PRO:068 or PRO:068 or PRO:068, PRO:068 or Computed o
                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer treatments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MKLAALLGLCVALSCSSAAAFLVGSAKPVAQPVAALESAAEAGAGTLANPLGTLNPLKLL

The present invention provides the human and murine uteroglobin related protein 1 (UGRP1) promoters. The sequences can be used in the diagnosis of and prediction of predisposition to respiratory disorders such as asthma. The present sequence is a protein sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MKLAALLGLCVALSCSSAAAFLVGSAKPVAQPVAALESAAEAGAGTLANPLGTLNPLKLL

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that encoding them. The polypeptides can be used to raise antibodies that compenies to a cell expressing a PRO protein and for modulating at least molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or for modulating at least complementary as chromosome markers, or in generating probes. The PRO identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as malecular markers for protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides are useful in diagnostic assays for tissue typing. Anti-PRO antibodies are useful in diagnostic assays for computal sources. The sequence provides presented in Assusoric assays for natural sources. The sequence provides presented in Assusoric data for this patent is also available in electronic format from USPTO at cell at the PRO sequence. Thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MKLAALLGLCVALSCSSAAAFLVGSAKPVAQPVAALESAAEAGAGTLANPLGTLNPLKLL 60

                                                                                                                                                                                                                                                                                       10-JUN-1998
                                                                                                                                                                                                                                                                                                                10-JUN-1998
                                                                                                                                                                                                                                                                                                                               10-JUN-1998
The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American type Culture Collection (e.g. ATCC Deposit No. 209621, 552-PTA, 819-PTA, 209439, 201315, etc); or a sequence with at least 80% identity to a DNA encoding a PRO polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, lew particularly useful for detecting or treating e.g. malignancies or cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, leukaemia or lymphoma), hepatitis B, multiple sclerossis, or Crohn's particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for the PRO particularly for the PRO particular weight markers are more contacted and transmembrane PRO polypeptide
         New genes and secreted and transmembrane polypeptides (e.g. PRO183 or PRO184), useful for treating or diagnosing e.g. ovarian cancer, Kaposi's sarcoma, leukemia, lymphoma, hepatitis B, multiple sclerosis or Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

The present invention relates to the isolation of novel human PRO polypeptides, and the polynuclectide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides, for linking biological activities of cells expressing PRO polypeptides, for modulating cartivities of cells expressing PRO polypeptides, and for for indentifying agonists or antagonists. The polynuclectide sequences encoding PRO polypeptides are useful as hybridisation probes, in the preparation of PRO polypeptides, for generating transgenic animals construct hybridisation probes for mapping the construct hybridisation probes for mapping the construct hybridisation probes for mapping the construct animals, to construct hybridisation probes for mapping the construct animals, to construct hybridisation probes for mapping the construct animals, and for the genetic analysis of individuals with genetic disorders, in gene therapy, for chromosome identification, as chromosome markers, and for generating probes for PCR, Northern analysis, Southern analysis and Western analysis, BOSCSS1 represent the human PRO polypeptides of the invention. Noce: The sequence data for this patent was obtained in electronic format directly con the USPTO web site at seqdata.uspto.gov/psipsDIDENTY.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MKLAALLGECVALSCSSAAAFLVGSAKPVAQPVAALESAABAGAGTLANPLGTINPLKLL 60
                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes and are therapeutically useful for enhancing immune responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MKLAALLGLCVALSCSSAAAFLVGSAKPVAQPVAALESAAEAGAGTLANPLGTLNPLKLL

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that encoding them. The polypeptides (for linking a bioactive specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. tumours in mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabits as targets for therapeutic intervention in certain cancers (e.g. colon, lung or breast cancers) and diagnostic determination of the presence of these cancers. The PRO polypeptides are also useful as molecular weight markers or for chromosome identification. The PRO genes are useful as hybridisation probes or for screening libraries of human colls, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences to presented in ABUS8900-ABUS9046 are the PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Godowski PJ;

SUBCELLULAR LOCATION: Lysosomal.

HISCELLANGOUS: The isoslectric point is 6.8. Has optimal activity at pH 2.5 with hemoglobin as the substrate and the optimal temperature is 37 degrees Celsius. This substrate and the optimal temperature is 37 degrees Celsius.

MINIARITY: Belongs to peptidase family Al.

             -1- CATALYTIC ACTIVITY: Specificity similar to, but narrower than, that of pepain A. Does not cleave the 4-Gln-|-His-5 bond in B chain of insulin.
-1- SUBUNIT: Consists of a light chain and a heavy chain.
-1- SUBCHILLAR LOCATION: Lysosomal.
-1- BOLYMORPHISM: The Val-58 allele is significantly overrepresented in demented patients (11.8%) compared with nondemented controls (4.9%). Carriers of the Val-58 allele have a 3.1-fold increased risk for developing AD than noncarriers.
-1- SIMILARITY: Belongs to peptidase family Al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ACTIVATION PEPTIDE.

-!- SUBUNIT: Occurs as a mixture of both a single chain form and two subunit: Occurs as a mixture of both a single chain form and types of two chain (light and heavy) forms.
-!- SUBCELUMAR LOCATION: Lysoscomal.
-!- SIMILARITY: Belongs to peptidase family Al.

GALLEY.

CATALYTIC ACTIVITY: Specificity similar to, but narrower than, protein Deakdown.

CHALYTIC ACTIVITY: Specificity similar to, but narrower than, that of pepsin A. Does not cleave the 4-Gln-[-His-5 bond in B chain of insulin.

CHECKLOWER: Description A. Does not cleave the a single chain form and two types of two chain (light and heavy) forms (By similarity).

CHECKLOWER: Defects in CTSD are a cause of congenital ovine neuronal ceroid lipofuscinosis (CONCL). CONCL is an autosomal recessive disorder. Newborn lambs are week, trempling, and unable to rise and support their bodies. However, they are able to vocalize, support their heads, and to suckle if bottle-fed. At autopsy, the brains of affected lambs are strikingly small. The deep layers of the cerebral cortex show pronounced neuronal loss, reactive astrocytosis, and infiltration of macrophages. There is severe degeneration of hippocampal pyramidal neurons.

CHECKLOWER: Deach of the procampal pyramidal neurons.

CHECKLOWER: Deach of the procampal pyramidal neurons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. Structural evidence for two isozymic forms and the carbohydrate attachment site of human gastric cathepsin E.";
Biochem. Biophys. Res. Commun. 168:878-885(1990).
-!- FUNCTION: Due ot its intracellular location and distribution in lymphoid associated tissue, it may have a role in immune function.
-!- CATALYTIC ACTIVITY: Similar to cathepsin D, but slightly broader

Nucleotide sequence of cDNA, hydrotytic specificity for biologically active peptides and gene expression during development.";

Eur. J. Biochem. 216:717-728(1993).
-!- FUNCTION: Due of its intracellular location and distribution in lymphoid associated tissue, if may have a role in immune function.
-!- CATALITIC ACTIVITY: Similar to cathepsin D, but slightly broader.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PLILLLPLINVEPSGATLIRIPLHRVQPGRRTLNLIRG-----WR-EPAELPKLGAPSPG

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Comment: Cathepsin D is a ubiquitous lysosomal proteinase.
C; Comment: In addition to the propeptide, residues 163-168 and 411-412 are proteolytical
C; Comment: The carbohydrate bound to 134-Asn contains a mannose-6-phosphate that is bount
C; Genetics: As Gene: GDB:120512; OMIM:116840
A; Gene: GDB:120512; OMIM:116840
A; Map position: lipl5.5-11pl5.5
A; Description: limited specificity endopeptidase
A; Pathway: intracellular protein degradation
C; Superfamily: pepsin

A; Experimental source: liver
C; Comment: Cathepsin D in rat liver lysosome occurs as a mixture of both a single chain
C; Function:
A; Description: limited specificity endopeptidase
A; Pathway: intracellular protein degradation
C; Superfamily: pepsin
C; Superfamily: pepsin
C; Superfamily: pepsin
C; Keywords: aspartic proteinase; glycoprotein; hydrolase; lysosome; protein degradation
C; Keywords: aspartic proteinase; glycoprotein; hydrolase; lysosome; protein degradation
C; Keywords: aspartic proteinase; glycoprotein; hydrolase; lysosome; protein degradation
